

## ÖPP project freeway A49

As part of the trans-European transport route network, the A49 freeway has an important key role. By closing the 61.8 km gap between the Schwalmstadt junction and the Ohmtal triangle, this has created further capacity on the A49 freeway. The 61.8 km route includes 7 viaducts, these structures are all equipped with SCHREIBER bridge bearings.

Due to the high engineering knowledge at SCHREIBER, the most economical as well as the most durable solution for the bearing of the structures was created by SCHREIBER engineers for each viaduct in this project. This repeatedly shows the technical competence of SCHREIBER.
